1. PURPOSE

1.1. The purpose of this assignment is to appoint a professional Service Provider to conduct an economic and social Cost-Benefit Analysis of climate change impacts and adaptation measures in key sectors of South Africa (water, health, human settlements, agriculture, energy), in line with the Climate Change Act, 2024 (Act No. 22 of 2024) using climate adaptation scenarios to:

- Evaluate the economic efficiency of climate resilience measures by comparing investment costs against avoided damages, and
- Evaluate long-term viability of responses by comparing costs against benefits (e.g., avoided damage) under different future climate trajectories, and
- Identify high-return strategies—often highlighting benefit-cost ratios (BCRs) of in key sectors to guide funding toward the most effective interventions and reduce residual risk.

2. INTRODUCTION AND BACKGROUND

2.1 The Department of Forestry, Fisheries and the Environment (DFFE) has recently revised adaptation scenarios for South Africa, largely driven by the Long-Term Adaptation Scenarios (LTAS) and the Climate Change Act, 2024 (Act No. 22 of 2024). These scenarios indicate that the country faces a hotter and more variable climate, posing a threat to key economic development sectors, including the sustainability of key natural resources. These climate-related pressures are compounded by existing socio-economic challenges, particularly poverty, inequality, and unemployment. South Africa is highly vulnerable to the impacts of climate change, which are expected to intensify risks related to drought, flooding, and extreme heat. These impacts will affect multiple sectors including water, health, human settlements, agriculture, and energy.

2.2 The Climate Change Act, 2024 (Act No. 22 of 2024) and all regulations and policy instruments issued thereunder, as well as the National Climate Change Adaptation Strategy (NCCAS) provide the strategic framework for strengthening climate resilience and ensuring that climate responses support a just transition toward a climate-resilient and low-carbon economy.

2.3 While significant work has been undertaken to model the biophysical impacts of climate change, there remains a critical need to translate these impacts into economic and social implications, particularly for vulnerable sectors and populations.

2.4 Traditional Cost-Benefit Analysis (CBA) approaches often fail to adequately capture unequal impacts across population groups, non-market and social values, and broader socio-economic implications of environmental change. To address these limitations, integrated economic modelling approaches are required to link environmental science with socio-economic analysis.

2.5 The Department therefore seeks to appoint a multidisciplinary team of experts that will conduct a comprehensive economic appraisal of climate change impacts and adaptation interventions across key vulnerable sectors. The appointed team will translate outputs from biophysical climate impact modelling into economic and socio-economic outcomes using integrated economic modelling approaches and cost-benefit analysis.

2.6 The findings will support evidence-based decision-making, inform climate adaptation planning, and guide policy development, budgeting, and investment prioritisation at national and sub-national levels. Particular emphasis will be placed on assessing the distributional and equity implications of climate change impacts and adaptation responses, ensuring that the analysis reflects the needs and vulnerabilities of marginalised communities.

3. OBJECTIVES

3.1. The objective is to appoint a service provider to undertake:
a comprehensive Economic and Social Cost-Benefit Analysis (ESCBA) for key sectors (water, health, human settlements, agriculture, energy) using climate adaptation scenarios to estimate cost of climate change impacts on human systems like GDP, poverty, and land use etc with focus on priority climate change adaptation interventions across identified key vulnerable sectors in South Africa. The service provider shall perform the services strictly within the approved scope, deliverables and timelines contained in this Terms of Reference. No variation of scope shall occur unless approved in writing by DFFE.

3.1.1. The specific objectives of the project are to:

- Develop and apply integrated economic modelling tools to translate biophysical climate impacts into measurable economic and social outcomes.
- Conduct comprehensive cost-benefit and cost-effective analyses of priority climate change adaptation interventions across vulnerable sectors.
- Assess the economic implications of climate change impacts on key sectors such as water, agriculture, energy, human settlements and health.
- Analyse the distributional and equity impacts of climate change and adaptation measures across vulnerable population groups, including gender, age, income and livelihood groups.
- Strengthen evidence-based policy and planning for climate change adaptation at national and sub-national levels.

- Contribute to capacity building and knowledge sharing through stakeholder engagement and technical dissemination of results.

4. SCOPE AND EXTENT OF WORK

The following is expected from the Service Provider:

4.1. Overview:

- Translating biophysical climate impact modelling outputs into economic and socio-economic outcomes.
- Apply integrated economic modelling approaches and cost-benefit analysis techniques to assess the economic viability, social implications, and distributional impacts of climate change adaptation interventions across key vulnerable sectors in South Africa.
- The analysis must support evidence-based decision-making, inform climate adaptation policy development, and guide investment prioritisation and planning at national and sub-national levels.

4.1.1. Review and Integration of Climate Impact Data

The service provider will review and analyse biophysical climate impact modelling outputs (to be provided by the DFFE) for water, health, human settlements, agriculture, energy sectors generated through the national scenario development process and identify quantifiable economic and socio-economic indicators. This involves translating physical changes (e.g., tons of lost crop) into monetary terms (e.g., lost farm revenue) using current price data.

Evaluating non-market impacts, such as reduced ecosystem services or health impacts through the use of shadow pricing.

4.1.2. Development of an Economic Modelling Framework

The service provider must develop and apply appropriate economic modelling frameworks to assess the impacts of climate change and adaptation interventions. The modelling framework may include the application of:

- Computable General Equilibrium (CGE) models to assess economy-wide impacts.
- Partial equilibrium models for sector-specific analysis.
- Input–Output models to estimate direct, indirect and induced economic impacts.

- Social Accounting Matrix (SAM) models for distributional analysis.
- Household microsimulation models where relevant.
- Integrated assessment models linking environmental and economic systems.

The modelling approach must clearly demonstrate how biophysical impacts are translated into economic outcomes and how sector losses ripple through the economy, affecting prices, consumption, and GDP in certain sectors.

4.1.3. Socio-economic Assessment - Distributional and Equity Analysis

The service provider must analyse the distributional impacts of climate change and adaptation interventions. Assessing impacts on household income, poverty levels, and employment. Identifying vulnerable regions and sectors to understand the "distributional impacts" of the climate burden. The assessment should estimate climate change impacts and provide a Distributional and Equity Analysis. The analysis should consider impacts across:

- Gender groups
- Income groups
- Vulnerable communities
- Geographic regions
- Economic output
- Employment
- Household income
- Productivity
- Resource availability

Where feasible, equity-weighted cost-benefit analysis should be applied.

4.1.4. Identification of Adaptation Interventions

The service provider will identify and analyse the impact of priority climate adaptation interventions for the selected sectors.

These interventions may include:

- climate-resilient infrastructure;

- improved water management strategies;
- climate-smart agricultural practices;
- early warning systems; and
- ecosystem-based adaptation solutions.

The service provider will develop an Adaptation Options Catalogue outlining the characteristics, implementation considerations and potential benefits of each intervention.

4.1.5. Economic Appraisal of Adaptation Interventions

The service provider will undertake a comprehensive economic appraisal of priority adaptation interventions using:

- Cost-Benefit Analysis (CBA)
- Cost-Effectiveness Analysis (CEA)
- Multi-criteria analysis where appropriate

The analysis must incorporate:

- Direct economic costs and benefits
- Indirect economic effects
- Social and environmental co-benefits
- Long-term climate resilience benefits

4.1.6. Scenario and Sensitivity Analysis

The service provider must conduct scenario analysis to evaluate the robustness of adaptation interventions under different climate and economic conditions. DFFE will provide the scenarios. This should include:

- Baseline scenarios
- Moderate climate change scenarios
- High-impact climate scenarios

Sensitivity testing must also be conducted to assess uncertainties related to:

- Discount rates

- Economic assumptions
- Climate variability.

5. EXPECTED DELIVERABLES / OUTCOMES

5.1. Inception Report

The inception report will outline:

- Detailed methodology
- Modelling framework
- Implementation plan
- Stakeholder engagement strategy
- Project workplan and timeline.
