7. Background

The Materials and Installation Business Unit requires the replacement of the old water bath, which uses outdated technology, with a modern water bath specifically designed for dielectric testing of cables. This updated method replicates conditions found in wet environments, which is essential for evaluating the performance and reliability of insulation materials. Dielectric testing enables the detection of insulation defects, providing a comprehensive assessment of the cables' ability to withstand moisture exposure. By submerging the cables in water, the test can uncover any weaknesses or flaws in the insulation that might compromise the cable's functionality, safety, and longevity. This process ensures that the cables meet industry standards for performance in real-world damp conditions

8. Scope of work

8.1 PURPOSE OF THIS DOCUMENT

Materials and Installation laboratory is accredited to conduct various tests on different cables with different sizes. The lab uses a water bath for the dielectric testing of cables to simulate real-world environmental stress, ensure uniform voltage distribution, and detect microscopic defects in the insulation. The water acts as a conductive earth electrode surrounding the entire cable surface, revealing potential failures that dry testing might miss. According to standards such as IEC 60811-402, testing involves submerging samples to measure how much water the insulating material absorbs over time. Excessive water absorption increases conductivity and decreases the overall dielectric strength of insulation. Cables, especially for outdoor or underground use, are often exposed to moisture. A water bath acts as an accelerated aging test, subjecting the cable to extreme moisture levels that might occur over years, but doing so within hours or days. This ensures that if the sheath is damaged, the resulting water ingress won't cause immediate electrical failure in the field.

A modern, automated water bath is essential for dielectric testing in a cable lab because it ensures compliance with international standards while providing precise, repeatable, and safe testing

conditions. Modern units specifically help by controlling temperature, ensuring uniformity, and automating the high-voltage application process, which improves the accuracy of insulation resistance and dielectric strength measurements

8.2 APPLICABLE AND REFERENCE DOCUMENTS

It is advised that the OEM product specification manual be referenced to understand the technical requirements of the equipment.

The following standards are some of the applicable
